

ARCHITECTURE.md

How this project actually works internally. Entirely project-specific – this is the one file that should look nothing like another project's copy.

Platform / language

UI framework

Local storage / database

Backend

(or: none)

Architecture pattern

e.g. MVVM, MVC – whatever actually fits

Data flow

Sketch it, even roughly:

UI → state/view-model → repository/service → storage

Key decisions

Anything non-obvious, and why – so it doesn't get
silently re-litigated later.
