

## **DESIGN.md**

What this should look and feel like. The categories are universal – the answers are project-specific.

### **Visual direction**

One or two sentences on the intended feel (e.g. "warm and playful" vs. "dense and technical").

### **Tokens**

- Color palette (named, hex)
- Type (family + scale)
- Spacing scale

These live in one theme source (AGENTS.md rule 4) – never redefined ad hoc in a component.

### **Components & navigation**

Core components, navigation structure, interaction patterns – what visibly happens on tap/click, error, and success.

### **States to design for**

Empty states, loading states, error states – not just the happy path.

## **Accessibility & responsiveness**

Anything specific to this project beyond a sane baseline.

## **Things to avoid**

No AI slop. No arbitrary one-off colors. No random padding. No unnecessary borders. No duplicated components doing the same job. No dead controls.
