

SPEC.md – Specification

Copy this per project, or per feature once a project is underway. Fill in every section before implementation starts. AGENTS.md is the rules the implementation follows; DESIGN.md and PROTOTYPE/ cover how it looks.

1. Purpose

What problem does this solve, and for whom?

2. Users

Who is this for?

3. Core functionality

What must it do, in plain language?

4. Features

List them. Mark each in-scope now vs. a later phase.

5. Out of scope

Explicit non-goals – prevents scope creep in both directions.

6. Acceptance criteria

Testable, checkbox-style. These feed TESTS.md directly.

Example, for an "add note" feature:

- ☐ Typing a title and clicking Save creates a new note
- ☐ The note appears in the list immediately, no manual refresh
- ☐ Reloading still shows it (confirms it persisted, not just local state)
- ☐ Edit changes the same note, not a duplicate
- ☐ Delete removes it from the list and from storage

7. Data / persistence

- Where does this live? (local storage, a database, a remote service)
- Which operations are required? (create / read / update / delete)
- How will "it actually persisted" be verified, not assumed?

8. Constraints & assumptions

Technical, performance, or accessibility constraints; anything you're assuming to be true going in.
